

Abstract of the Disclosure

In a maintenance system for an analyzing instrument, a maintenance department remotely operates a first computer by a second computer to execute an initial inspection and a basic function inspection of the instrument. Then, an abnormality contained in the result information for every executed inspection is specified, and optimum maintenance information for solving the specified abnormality is searched in a server and extracted. Thereafter, the extracted maintenance information is sent to the first computer in the user side. Namely, an operator at the user side is only required to deal with the maintenance of the instrument in accordance with the maintenance information sent from the maintenance department.
